USB Rufus V3.8 Final !!TOP!!

Once you complete the steps, Rufus will create a bootable USB media that will bypass the security and memory requirements to upgrade or install a fresh copy of Windows 11 on virtually any supported or unsupported hardware. (See also this video tutorial on the Pureinfotech YouTube channel to complete this task.) With Rufus, you can also create a Mac- or Linux-specific Live USB, or use it to restore a single Windows system. For Linux and macOS users, the tool also works well to create live bootable USB media for Android, Chrome OS, iOS, and virtual machines. If you are confused about the steps listed below, please refer to the video tutorial: Hello Everyone! I'm back and am excited to make more videos to help you with your personal computers! With the release of Windows 10, Microsoft is making it an even bigger deal to perform the updates yourself to maintain your Windows and other devices. However, I wanted to make a step by step tutorial on how to use the popular USB Image Creator application to perform this task. Just like the video mentioned previously, hopefully this will help you out and get you up and running with the process to upgrade your OS. Thank you for watching and we would be excited to hear your feedback on this, as well as others that might be interested in performing this task. You don't need any special skills for this, or any software. The process is really easy to follow and we found it to be pretty simple. We have been getting a lot of requests for this step by step process, so we wanted to make one, and today we finally have! So, go grab a beverage of your choice, and follow along as we show you how to perform the update yourself! - Brian https://www.youtube.com/watch?v=uoiwqr4TniM Below I have listed the steps for creating a bootable USB installation using Rufus.

USB Rufus V3.8 Final

hi. i have been using rufus since it was free. i have no real problems with it. however, when i upgraded to windows 10, i lost my ability to boot off usb. i created a bootable windows 10 usb, and i am able to boot from that. my question is, why is it that i can boot from usb, but i cannot see the files on that usb? shouldn't they be in the same location? i'm not really sure how to fix this. gosh i cant believe i am still running 2.0.1. i was really excited to update to the latest, but i couldnt find any review sites i could trust, so i just did a manual update instead. it was a complete pain in the ass. im currently on my 2nd attempt, but this time im putting in a win 10 iso instead of a usb stick. 2nd time running into an issue though. when i run the win 10 installation setup, it just goes through the background steps, with a big progress bar and then gives me a message saying "setup has failed to finalize the current installation. please close the application and then retry setup." and then it just restarts back to the start menu, but it says that its just closed. i tried to force shutdown, but that didnt do any good. the only way i can get this installation running again is to completely uninstall and start over. ive been using this tool for at least the last 8 years. it has been my go to when i need to create bootable usb sticks for any linux distros. i was just amazed to see that rufus has a new release! ive always done this manually, but with this new release, it finally has a very simple graphical interface that you can use from the start menu. this is really a great tool and i am proud to have it installed on my system. 5ec8ef588b
